Reflection

I created my infographic to convey that there is more to code than programming. Unlike many infographics shown in class, which focused on statistics and graphs, mine compares the meaning of Code through descriptions.

Visually, I designed it in a way to draw the viewer to the centre. The viewer is encouraged to read the computing section next through the use of bolded text above in their peripheral vision, drawing their gaze. From here they can gain knowledge about what code in computing is and can compare that to the other sections.

My design had three drafts. I began as simply as possible to get a general idea. Then I removed a section to reduce clutter and added annotations. In my final draft I drew what I wanted the layout to look like and listed talking points. When I was creating the infographic, I realised including extra details made it very cluttered and unappealing, so I simplified to a more minimal design. To keep it easily digestible, I utilized the 70/30 rule commonly used in art to keep my design clean and easily digestible.

Through this process I have discovered how infographics use visual hierarchies to control how a person absorbs information. This is very powerful and could change how they interpret information. This could be a point of concern when bias or omission are a part of the creation process. Overall, this has improved my ability to recognize when an infographic is being deliberate in influencing my interpretation.
